

Pagero e-invoice

Pagero offers scalable e-invoice services that enables companies to communicate digitally with all their suppliers and buyers, regardless of invoice volume and ERP system.

All communication is performed on one common platform: **Pagero Online**. The service is delivered as a cloud service.

Pagero's solutions do not alter the existing business processes. However, they significantly improve them, thanks to reducing unnecessary manual work, leading to greater efficiency and control, improved security, shorter credit periods and reduced environmental impact.

Our network Pagero Online

Pagero Online has a unique many-to-many architecture, which enables companies of all sizes to easily and by themselves connect to the network and communicate with each other without any expensive project costs.

It does not matter which invoice format (CSV, XML, EDI etc) the company uses, since all transactions automatically are converted from any supplier format to the correct buyer format in Pagero Online. The recipient can also activate a validation service to ensure that the content of all received transactions is correct.

It is important that users easily can add new suppliers or buyers to the network, without any involvement from the operator. For this reason, we have developed Pagero e-business locator. Pagero e-business locator allows users to add new suppliers and buyers without any intervention from Pagero.

All handling of data traffic has to be based on high security and data integrity. Company information is under continuous threat of being disclosed by competition. Pagero Online is built to provide the same security level as bank

information and all data is encrypted wall to wall. We also have built an extensive receipt handling function to ensure delivery.

No single operator can support global data communication. For this reason, Pagero has signed roaming agreements with a number of operators. This allows our customers to communicate with companies using other operators.

Connecting to Pagero Online

There are different ways to connect to Pagero Online, depending on demands for automation. With all options it is possible to both send and receive e-invoices:

Pagero Web Portal (manual) is a fully web-based service with an easy to use interface for invoice processing in Pagero Online. No installation of any software is required to access Pagero Online. Pagero Web Portal is a flexible solution that allows small businesses to simplify and streamline their invoice processing routines without having to invest in a wfinancial or ERP system.

Pagero Connect (semi-automatic) includes a virtual printer: Pagero Printer. Invoice data is created as usual in the financial system, but instead of printing via a paper printer, Pagero Printer is selected. Invoice data is interpreted and delivered electronically to customers via Pagero Online. Pagero Connect also works for companies creating electronic invoices (CSV, XML, EDI) directly in their financial system.

Pagero Server Connect (automatic) allows companies to send and receive e-invoices automatically, to and from their workflow or ERP via Pagero Online without any manual processing. Pagero Server is a powerful service for companies groups with multiple legal entities.

Companies requiring a direct communication link to Pagero Online can use our **customer specific communication**, for example via FTP, SFTP, HTTPS or AS2.
